Weekly Commentary

What the heck was that? The simple version: It was a week that began with a global selloff, but after a massive comeback, finished with very little damage done. The S&P 500 declined 0.5% to 2918.65. Trading, however, was far more complicated. The Dow gave up 767.27 points, or 2.9%, on Monday after China let its currency weaken past 7 yuan to the dollar. It rallied back more than 300 points on Tuesday. Then, after India, Thailand, and New Zealand decided that the global economic situation was dire enough to require some unexpected rate cuts, it tumbled another 580 points, or 2.3%, through Wednesday's low—before erasing nearly all of those losses.

In fact, the Dow would have been positive that day if it hadn't been for Walt Disney (ticker: DIS), whose stock dropped 4.9% after it released disappointing earnings.

If all that weren't enough, gold prices soared above \$1,500 an ounce for the first time since 2013, while the 30-year U.S. Treasury briefly yielded 2.12%, its lowest since 2016.

Clearly, the market was signaling that something was very wrong.

Or maybe it was just the way the market was positioned that was responsible for the wild volatility. Part of the problem was that hedge funds were late to the rally, according to Nomura strategist Masanari Takada, and had only started building up bullish equity positions in mid-June. The market's sudden turn after the double whammy of the Federal Reserve's rate cut on July 31 and Trump's new tariff announcement on Aug. 1 meant that those positions quickly went from winners to losers. Trend-following commodity trading advisors, or CTAs, started dumping stocks on Monday, after the S&P 500 opened below its 50-day moving average, which also added to the extreme downside.

Takada expects more where that came from. "We would expect any near-term rally to be no more than a head fake, and think that any such rally would be best treated as an opportunity to sell in preparation for the second wave of volatility that we expect will arrive in late August or early September," he writes.

Sounds scary, right? JPMorgan strategist Marko Kolanovic swims in the same flows as Takada but comes away with a different point of view. With the S&P 500 now sitting between its 50-day and 200-day moving averages, CTAs have as much chance of being forced to buy as to sell, he says. The big market decline has also meant that corporations, which had been in blackout periods because of earnings season, were able to buy again. Kolanovic describes these companies as "sensitive to stock-price declines" and argues that the S&P 500's drop, likely caused repurchases to triple.

Funds that have fixed weightings to stocks and bonds might also be forced to rebalance earlier than normal thanks to the big drop in stocks and big gains in bonds. "Given very low liquidity, volatility will stay elevated," Kolanovic writes. "We do think that after a short period of stabilization, markets will regain previous highs."

You'll notice that none of this addresses the fundamentals, and that's because fundamentals had little to do with the moves. Rather, the volatility was the market's way of thinking through the potential impact of the new tariffs and an escalating trade war between the U.S. and China on fundamentals—and on how much those fundamentals would be worth.

Consider: At its 2019 peak on July 26, the S&P 500 was trading at 18.3 times forward earnings; at its closing low this past Monday, it was trading at 17.1 times. It finished the week roughly in between.

Time will tell if that's too much.

Securities offered through Raymond James Financial Services, Inc. Member FINRA/SIPC. Investment advisory services offered through Raymond James Financial Services Advisors, Inc. Forman Investment services is not a registered broker/dealer and is independent of Raymond James Financial Services, Inc.

Companies engaged in business related to a specific sector are subject to fierce competition and their products and services may be subject to rapid obsolescence. There are additional risks associated with investing in an individual sector, including limited diversification. The 10-year Treasury note is a debt obligation issued by the United States government with a maturity of 10 years upon initial issuance. U.S. government bonds and Treasury bills are guaranteed by the U.S. government and, if held to maturity, offer a fixed rate of return and guaranteed principal value. If bonds are sold prior to maturity, you may receive more or less than your initial investment. Holding bonds to term allows redemption at par value. There is an inverse relationship between interest rate movements and bond prices. Generally, when interest rates rise, bond prices fall and when interest rates fall, bond prices generally rise.

The Dow Jones Industrial Average (DJIA), commonly known as "The Dow" is an index representing 30 stock of companies maintained and reviewed by the editors of the Wall Street Journal. The S&P 500 is an unmanaged index of 500 widely held stocks that is generally considered representative of the U.S. stock market. The NASDAQ Composite is a stock market index of the common stocks and similar securities listed on the NASDAQ stock market. Keep in mind that individuals cannot invest directly in any index. Individual investor's results will vary. The Russell 2000 Index measures the performance of the 2,000 smallest companies in the Russell 3000 Index, which represent approximately 8% of the total market capitalization of the Russell 3000 Index. Past performance does not guarantee future results. Investing involves risk and you may incur a profit or loss regardless of strategy selected. Prior to making an investment decision, please consult with your financial advisor about your individual situation.

The yield curve is a graphic depiction of the relationship between the yield on bonds of the same credit quality but different maturities.

Investing in commodities is generally considered speculative because of the significant potential for investment loss. Their markets are likely to be volatile and there may be sharp price fluctuations even during periods when prices overall are rising.

There is no assurance any of the trends mentioned will continue or forecasts will occur. Forward looking data is subject to change at any time and there is no assurance that projections will be realized.

The companies engaged in the communications and technology industries are subject to fierce competition and their products and services may be subject to rapid obsolescence. Gold is subject to the special risks associated with investing in precious metals, including but not limited to: price may be subject to wide fluctuation; the market is relatively limited; the sources are concentrated in countries that have the potential for instability; and the market is unregulated. Be advised that investments in real estate and in REITs have various risks, including possible lack of liquidity and devaluation based on adverse economic and regulatory changes. Additionally, investments in REITs will fluctuate with the value of the underlying properties, and the price at redemption may be more or less than the original price paid.

Diversification and asset allocation do not ensure a profit or protect against a loss.

Investing in oil involves special risks, including the potential adverse effects of state and federal regulation and may not be suitable for all investors.

International investing involves special risks, including currency fluctuations, differing financial accounting standards, and possible political and economic volatility.
